Rationale

- Current standard-of-care (SOC) on-demand treatment (ODT) options for hereditary angioedema (HAE) attacks are administered by injection, which
 presents a burden for people with HAE¹⁻⁵ and leads to treatment of attacks often being delayed or forgone.⁶⁻¹⁰
- An unmet need exists for oral ODT options that are effective and well-tolerated and that may reduce the treatment burden by enabling prompt, discreet administration.¹⁰
- Deucrictibant is an orally administered, highly potent, specific antagonist of the bradykinin B2 receptor under development for prophylactic and ondemand treatment of HAE attacks.
- To date, clinical trials comparing deucrictibant immediate-release (IR) capsule for ODT of HAE attacks with SOC have not been conducted.

Methods

• A propensity score matching (PSM) method¹¹ (**Figure 1**) was used to compare clinical outcomes between the cohort from RAPIDe-2,¹² a clinical study treating HAE attacks with deucrictibant IR capsule, and a cohort from a mixed-methods observational real-world study treating HAE attacks with SOC.¹³

Figure 1. Overview of PSM

- A statistical technique used in non-interventional studies that aims to mimic a randomized experiment by simulating a head-to-head comparison when randomization is not feasible.¹¹
- Goal is to balance the observed differences between participants in the treatment and potential control groups by matching participant characteristics using propensity scores.¹¹

Patients with similar baseline characteristics, such as sex, age, or disease type, are matched between a group of interest and a control group.

Results

- As of the data cutoff of 1 March 2024, RAPIDe-2 included 17 participants who reported 258 non-laryngeal attacks. All attacks were treated with deucrictibant IR capsule.
- The mixed-methods study included 29 participants who reported 97 non-laryngeal attacks from 20 November 2022 to 17 April 2023. All attacks were treated, and the most common medications reported were icatibant (60.2%) and C1-inhibitor concentrate (31.7%; **Table 3**).
- Baseline characteristics were generally similar between cohorts (Table 4).

Table 3. On-demand treatments^a used for non-laryngeal HAE attacks (N=98^b) reported by 29 adults in the mixed-methods study

Treatment	Taken at attack onset n (%)	Taken as additional dose n (%)	Taken as additional new treatment n (%)
Icatibant	59 (60.2)	8 (8.2)	0 (0)
Plasma-derived C1-INH	22 (22.5)	0 (0)	0 (0)
Recombinant C1-INH	9 (9.2)	2 (2.0)	0 (0)
Other ^c	9 (9.2)	4 (4.1)	6 (6.1)

C1-INH, CI inhibitor; HAE, hereditary angioedema. ^aThese percentages are calculated based on the total 98 non-laryngeal attacks represented in this table. ^bParticipants could take multiple medications for each attack onset, either as additional doses (e.g., 2 doses of icatibant) or as additional new treatments (e.g., icatibant and diphenhydramine). ^cOther treatments used included tranexamic acid (n=6), diphenhydramine (n=1), and lanadelumab (n=1), with one not stated.

Table 4. Baseline characteristics

	RAPIDe-2 cohort (deucrictibant IR capsule)	Mixed-methods cohort (SOC)
Participants, n	17	29
Treated attacks per participant, mean (min, max)	15 (1, 42)	3 (1, 9)
Age in years, mean (min, max)	43 (20, 71)	41 (18, 70)
Sex: female, n (%)	11 (64.7)	20 (69.0)
Ethnicity: non-Hispanic, n (%)	13 (76.5)	28 (96.6)
HAE type, n (%)		
НАЕ Туре 1	16 (94.1)	28 (96.6)
НАЕ Туре 2	1 (5.9)	1 (3.4)

- Patients with similar baseline characteristics, such as sex, age, or disease type, are matched between a group of interest and a matched control group, and then outcomes are compared between the PSM groups.¹¹
- PSM has been used for comparative analyses in other conditions such as multiple sclerosis.¹²

PSM, propensity score matching.

• Data sources (Table 1)

- RAPIDe-2 (NCT05396105) study¹² of deucrictibant IR capsule for treatment of HAE attacks.
- An ongoing Phase 2/3 open-label extension study
- Evaluating outcomes of long-term use of deucrictibant IR capsule for treatment of HAE attacks.¹¹
- For further information, please see the poster Treatment of HAE attacks with oral deucrictibant: RAPIDe-2 extension results by Maurer et al.
- Observational mixed-methods study¹³ of SOC (e.g., icatibant, C1-inhibitor, etc.) for treatment of HAE attacks.
- Evaluated patient-reported outcome (PRO) assessments to be used in ODT clinical trials of deucrictibant IR capsule.
- Clinical outcomes among people with HAE who treated their attacks with SOC were also assessed.

Table 1. Data sources and study parameters for PSM

RAPIDe-2 study ¹²	Mixed-methods study ¹³	
Clinical study	Observational study	
28 December 2022 to 1 March 2024	20 November 2022 to 17 April 2023	
Deucrictibant IR capsule 10 mg, 20 mg, or 30 mg	Standard of care (e.g., icatibant, C1-inhibitor, etc.)	
Participants \geq 18 years of age with HAE Type 1 or 2	Participants \geq 16 years of age with HAE Type 1 or 2	
Primary endpoint Safety, including TEAEs, clinical laboratory tests, vital signs, and ECG findings. 	RAPIDe-2 study ¹² Clinical study 28 December 2022 to 1 March 2024 Deucrictibant IR capsule 10 mg, 20 mg, or 30 mg Participants ≥18 years of age with HAE Type 1 or 2 Primary endpoint Safety, including TEAEs, clinical laboratory tests, vital signs, and ECG findings. Secondary endpoints	

Outcomes are then compared between the PSM group of interest and the PSM control.

HAE, hereditary angioedema; IR, immediate-release; max, maximum; min, minimum; SOC, standard of care.

• For the base case (N=73 attacks):

- The RAPIDe-2 study cohort achieved symptom relief significantly faster than the mixed-methods study cohort, as indicated by the median time to PGI-C "A little better" and "Better" and to 1-level improvement in PGI-S (**Figure 3**).

• The results from the sensitivity analyses were consistent with the base case.

Figure 3. KM estimates for median (95% CI) time to event, PSM base case analysis^a

A. Time to symptom relief defined as PGI-C "A little better"

70

Impression of Severity; PRO, patient-reported outcome; PSM, propensity score matching; TEAE, treatment-emergent adverse events.

 During an HAE attack, participants in both studies completed 3 PRO assessments: the Patient Global Impression of Change (PGI-C), the Patient Global Impression of Severity (PGI-S), and the Angioedema syMptom Rating scAle (AMRA) (Figure 2).

PRO, patient-reported outcome.

- In both studies, PRO assessments were completed at pre-treatment and every hour up to 4 hours following treatment administration and then at 8, 12, 24, and 48 hours.
- PSM analysis endpoints were time to PGI-C "A little better" or "Better", time to 1-level improvement in PGI-S, and time to PGI-S "None" (Table 1).
- PSM analysis parameters are reported in **Table 2**.

• Kaplan-Meier estimates were calculated comparing the RAPIDe-2 study cohort treating HAE attacks with deucrictibant IR capsule with the mixed-methods study cohort treating attacks with SOC for each endpoint.

Table 2. PSM analysis parameters

	Selected attacks	Matching algorithm	Participant characteristics matched
Base case	First 10 consecutive attacks	Greedy Nearest Neighbor 1:1 with Caliper = 0.5	Sex, age, baseline attack severity, ^a and exact attack primary location
Sensitivity analysis 1	First 10 consecutive attacks	Greedy Nearest Neighbor 1:1 with Caliper = 0.5	Sex, age, and baseline attack severity ^a
Sensitivity analysis 2	Maximum of 10 attacks selected randomly	Greedy Nearest Neighbor 1:1 with Caliper = 0.5	Sex, age, and baseline attack severity ^a
Sensitivity analysis 3	First 10 consecutive attacks	Greedy Nearest Neighbor optimal ratio with Caliper = 0.5	Sex, age, and baseline attack severity ^a

AMRA, Angioedema syMptom Rating scAle; PSM, propensity score matching. ^aDefined by AMRA score.

Mixed-methods study cohort (SOC): 71 69 63 58 51 45 42

73 69 65 60 55 52

Number at risk:

RAPIDe-2 study cohort

(deucrictibant IR capsule):

AMRA, Angioedema syMptom Rating scAle; CI, confidence interval; IR, immediate-release; PGI-C, Patient Global Impression of Change; PGI-S, Patient Global Impression of Severity; PSM, propensity score matching. N=73 for both cohorts. ^aParameters: The first 10 consecutive attacks were selected for each participant; Greedy Nearest Neighbor 1:1 matching was used with Caliper = 0.5; participants were matched for sex, age, baseline attack severity (defined by AMRA score), and exact attack primary location.

45

37

Conclusions

This PSM analysis provides evidence that a cohort of participants with HAE in a clinical study treated with deucrictibant IR capsule had more favorable outcomes on PGI-C- and PGI-S-based assessments when compared with a cohort treated with SOC in an observational study.
